

Offline-selected candidates can lose after fixed-interface deployment.

A. Fixed-interface selection-transfer audit

candidate rule: $\pi_m = I_\theta \circ f_m$

B. Winner inversion under fixed-interface deployment

Arrows show offline-selected → deployed-utility winner
Counts show deployed-suboptimal units

	$\kappa = 0.00^*$	$\kappa = 0.50$	$\kappa = 1.00$
Event-micro	Sharp → Sharp subopt. 38/100	Sharp → Calib. subopt. 69/100	Sharp → Smooth subopt. 99/100
Traffic-Hourly Top-k	Short → Short subopt. 0/100	Short → Smooth subopt. 100/100	Short → Smooth subopt. 100/100
Inventory	MLP → MLP subopt. 23/100	MLP → MA(7) subopt. 74/100	MLP → MA(7) subopt. 99/100

□ zero-friction reference □ partial transfer / mixed □ winner changes ■ recurrent suboptimality

*Gray cells are zero-friction references, not friction-causal evidence.
