

Forecast-side winners can diverge under fixed interfaces.

A. Fixed forecast-to-decision interface

same interface, different forecast source

Q2 fixes the interface and asks whether the forecast-side winner remains the deployed-side winner.

B. Winner-inversion matrix

arrows: aggregate winners; counts: seed-level deployed-suboptimal cases

	$\kappa = 0.00$	$\kappa = 0.50$	$\kappa = 1.00$
